“Macro Functions” of a Public Debt Risk Manager

A Long-Run Benchmark

Public Debt Risk Indicators

2

The Risk Manager and the Strategy Planning Design

3

Concluding Remarks

5

Motivation

- Implementation of modern risk management practices has ranked high in the agenda of public debt managers
- Focus on strengthening Middle-Office capability
- Public debt risk management: a key attribution in Debt Management Offices (DMOs)
- The Brazilian National Treasury engaged in 2001 in a program to build capacity and develop tools and systems for risk management
- Two years later, the Brazilian risk management framework was presented and validated in a seminar attended by experts from several countries and international organizations

Motivation

- A number of studies have been produced by the Brazilian DMO
- However, there is still a gap in the understanding of how these individual pieces of work can be put together to form the complete set of attributions of the public debt risk manager.
- This paper describes the scope of activities and the fundamental challenges faced by the public debt risk manager

“Macro Functions” of a Public Debt Risk Manager - Debt Sustainability Exercises

- Enhanced and accurate debt dynamics and sustainability exercises
- Strengths: refined skills and privileged access to information regarding the debt refinancing strategy
- Conventional assessments based on deterministic forecasts
- Include stochastic analysis
- Include the refinancing strategy (an insider)
 - More important in countries with unstable debt profiles;
 - Countries that have large share of debt maturing in the short term;
 - These are exactly the countries that DSA are more relevant

“Macro Functions” of a Public Debt Risk Manager

Table 1: Deterministic vs. Stochastic Simulation Results (100% floating rate debt)

Period	average DL (determ.)	Average DL (stoch.)	Volat	Relat. Volat
0	51,70%	51,70%	0,00%	0,00%
1	49,94%	49,93%	4,25%	8,50%
2	48,19%	48,09%	6,10%	12,69%
3	46,04%	46,00%	7,68%	16,69%

“Macro Functions” of a Public Debt Risk Manager

A Long-Run Benchmark

Public Debt Risk Indicators

2

The Risk Manager and the Strategy Planning Design

3

Concluding Remarks

5

A Long-Run Benchmark

- A guideline to the short and medium term debt management strategies
- Active search for methodologies in many countries
- Usually, the benchmark is represented by some set of relevant debt indicators, such as composition, duration, debt profile etc.
- Some countries determine their benchmarks based on very simple analysis and ad-hoc assumptions
- Others develop risk indicators and investigate trade-offs in outputs
- Others use an even more analytical framework from which the “optimal” portfolio emerge endogenously

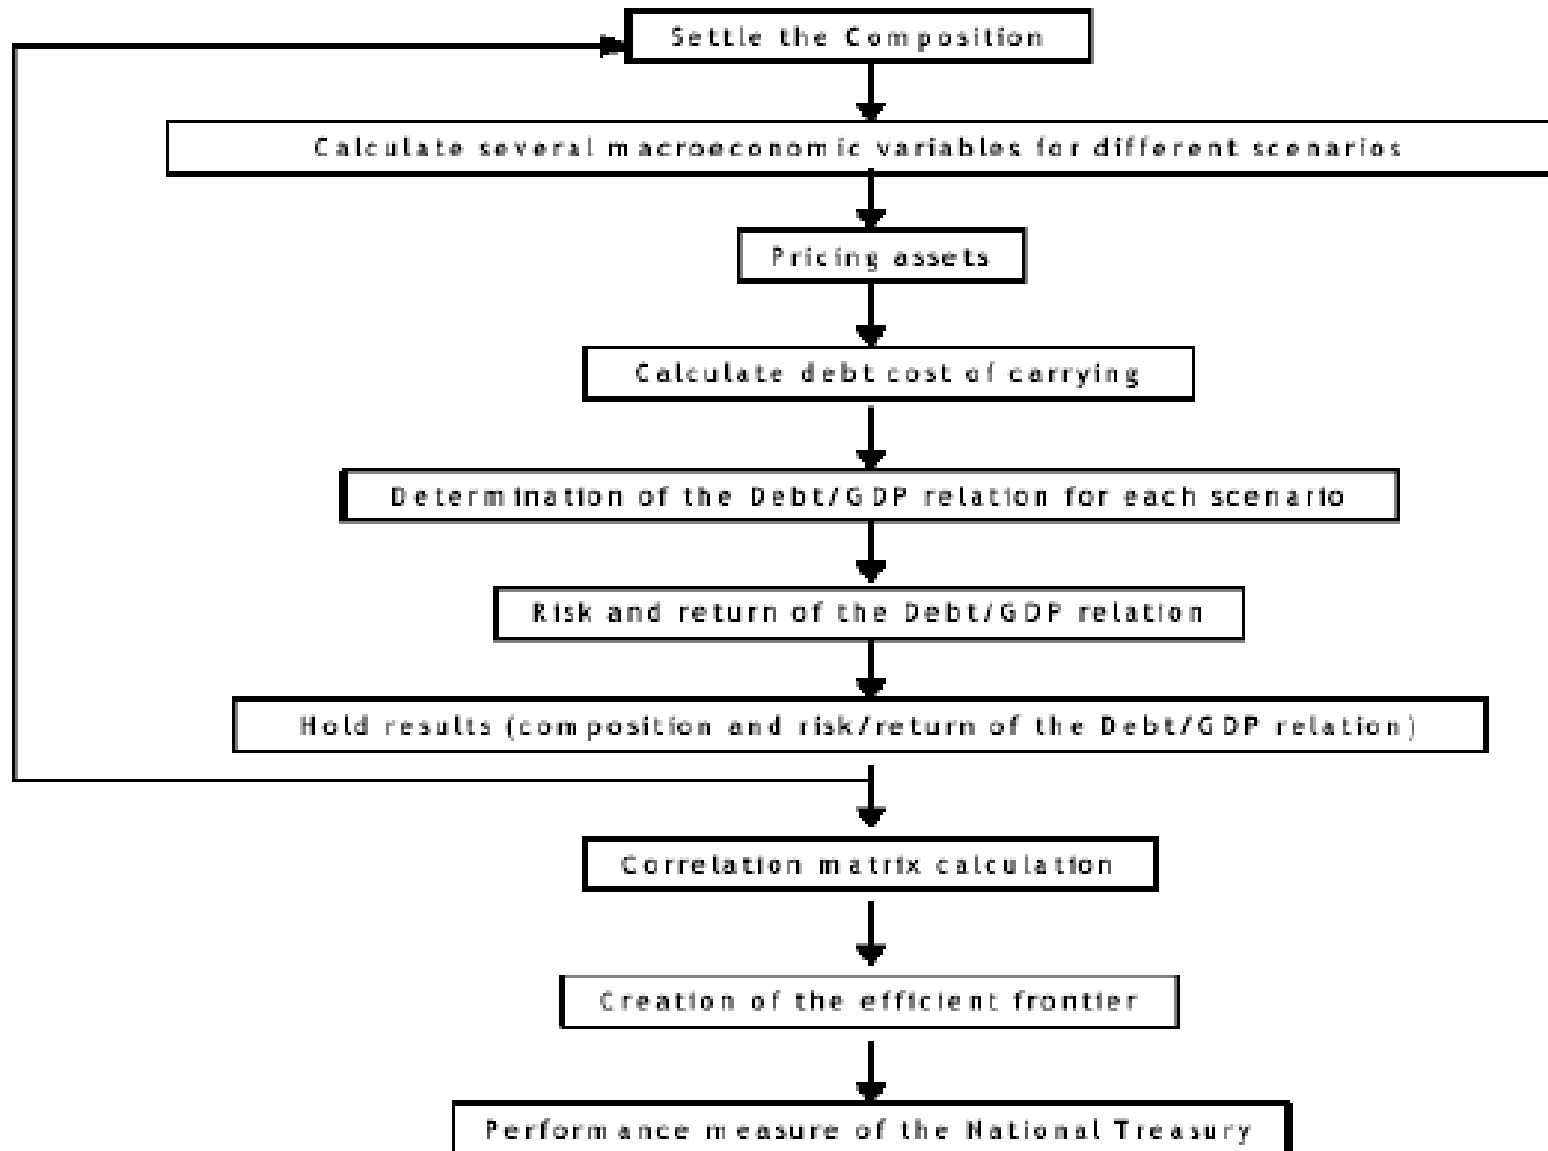

A Long-Run Benchmark - The Brazilian Approach

- An efficient frontier analysis in terms of the debt/GDP ratios
 - Steady-state compositions are simulated through a number of different periods
 - With some portfolios evaluated in terms of cost and risk, as well as the correlation matrix, it is possible to draw an efficient frontier
 - The debt manager chooses, based on its risk appetite, the single point representing the benchmark

A Long-Run Benchmark

A Long-Run Benchmark

Stochastic Processes:

Interest Rate Process: Cox-Ingersoll and Ross (CIR)	$dJ_t = \alpha (J^* - J_t)dt + \sigma_1 \sqrt{J_t} dz_t^1$
Real FX rate Process: Chan, Karolyi, Longstaff and Sanders (CKLS)	$dC_t = \beta (C^* - C_t)dt + \sigma_2 C_t dz_t^2$
Domestic Inflation: Geometric Brownian Motion	$dI_t = \mu I_t dt + \sigma_3 I_t dz_t^3$
External Inflation: Deterministic Process	$dI_t^e = \mu^e I_t^e dt$

A Long-Run Benchmark

Macro Structural Model:

IS equation:

$$y = \beta r_{-1} + \delta e_{-1} + \lambda y_{-1} + \varepsilon$$

Phillips Curve:

$$\pi = \zeta \pi_{-1} + \alpha y_{-2} + \gamma (e_{-1} - e_{-2}) + \eta$$

Nominal FX rate:

$$e = \chi Embi + v$$

Country Risk:

$$Embi = \kappa Embi_{-1} + \varpi (Divida / PIB)_{-1} + v$$

Taylor Rule:

$$r = \rho r_{-1} + \psi (\pi_{-1} - \pi^*) + \phi y_{-1}$$

Debt Dynamic:

$$\frac{Divida}{PIB} = \frac{(1 + cc)}{(1 + g)} \left(\frac{Divida}{PIB} \right)_{-1} - \frac{Pr imário}{PIB}$$

Agenda

Motivation

A Long-Run Benchmark

Public Debt Risk Indicators

2

The Risk Manager and the Strategy Planning Design

3

Concluding Remarks

5

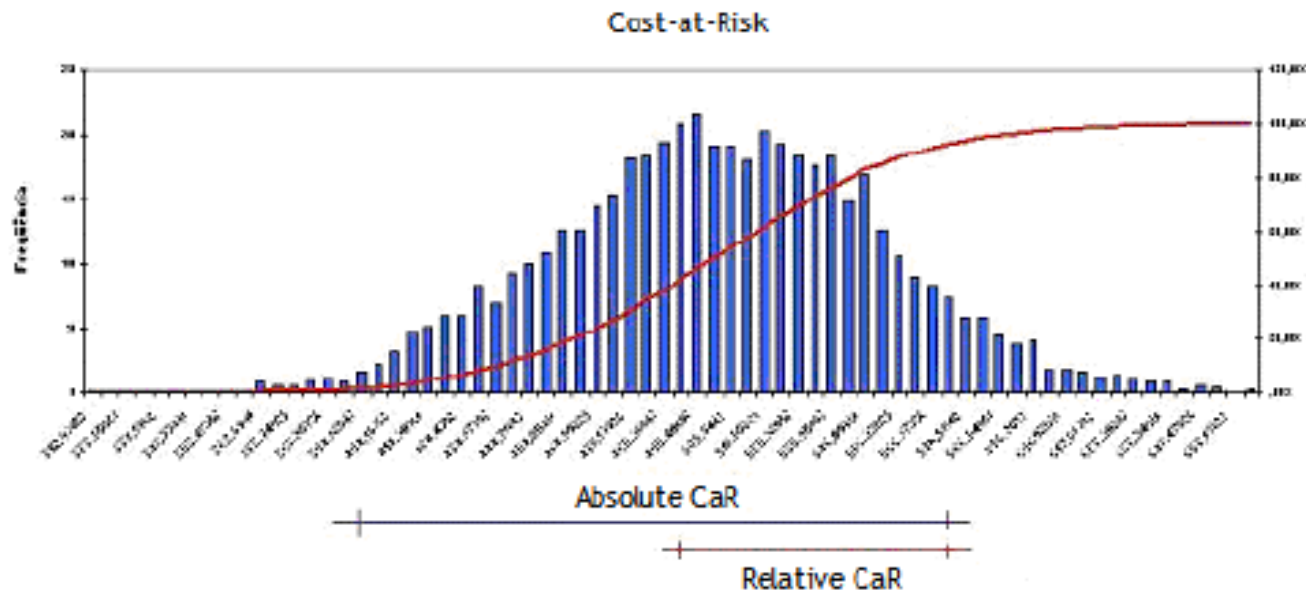

Public Debt Risk Indicators

- Traditional vs. Stochastic

- MARKET RISK

- uncertainty related to the expected costs owing to the volatility in the market indexes or currencies
- duration, refixing-duration and convexity
- the Cost-at-Risk (CaR) represents the maximum expected value that the debt stock can reach over a determined period, given a certain level of significance
- stress tests

Graph 7: Cost-at-Risk (CaR)

Public Debt Risk Indicators

REFINANCING RISK

- defined as the risk of adverse changes in the stream of debt payments upon its refinancing
- extreme cases: incapacity of a government to roll-over
- average life, percentage of the debt maturing in the short term (usually in one year)
- Cash-flow at Risk (CfaR): CfaR measures, with some level of significance, the maximum expected cash-flow (payments) at the specific dates or periods in the future

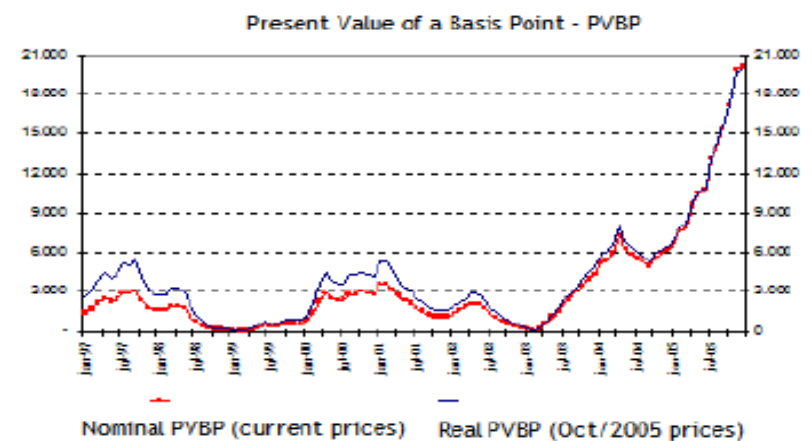

Public Debt Risk Indicators

BUDGET RISK

- the concept of Budget-at-Risk (BaR): risk that the debt service within a fiscal year (the official Budget period) surpasses the amount originally approved by Congress
- focused in one year
- exogenous reference value which is approved by the Congress => probability of exceeding that value.

DEMAND SIDE RISK

- risk of sudden shifts in the demand for government bonds
- most common driver: interest rates
- Investors due to stricter prudential regulations, internal investment policy, etc

The Risk Manager and the Strategy Planning Design 3

Concluding Remarks

5

The Risk Manager and the Strategy Planning Design

■ Process of design, implementation and monitoring:

1. Definition of long-term objectives and guidelines;
2. Development of Macroeconomic Scenarios;
3. Preliminary discussions of scenarios and restrictions;
4. (Transitional) Strategy design and preliminary risk assessment;
5. Definition of targets: Expected results
6. Analysis of opportunities and challenges in the following years⁴³;
7. Tactical debt planning and execution (short-term) and
8. Monitoring the implementation of the transitional strategy (Annual Borrowing Plan)

■ Role in Transitional Strategy design

- select and adequately employ the tools that were developed to measure the various types of risks across different potential strategies

Results and Targets for the Federal Public Debt - DPF

Indicators	Dec-04	PAF-2005	
		Minimum	Maximum
Stock of DPF held by the public (R\$ billion)	1013.9	1180	1240
Average maturity of DPF (months)	35.3	36	41
% Maturing in 12 months	39.3	34	40
Share of DPF (%)			
Fixed rate	16.1	16	25
Floating rate	45.7	39	47
Exchange rate	24.2	12	16
Price Index	11.9	18	23
Others	2.1	1	3

Concluding Remarks

5

Concluding Remarks

- Aim: draw attention to the role of the public debt risk manager, providing a comprehensive view of her principal functions
- Ambitious task, subject to several gaps and criticisms
- In an environment that debt offices around the world have been paying significant efforts to modernize their risk management practices this can serve as a starting point to get a good grasp of the activities involved
- It also serves to enhance the awareness of Brazilian policy makers on how to best explore the skills and outputs that can be provided by public debt risk managers.
