## 1 pt

An automobile driver fills his 17.1-L steel gasoline tank in the cool of the morning when the temperature of the tank and the gasoline is $15.0^{\circ} \mathrm{C}$ and the pressure is 1.09 atm . The can is completely full. The temperature climbs to $29.3^{\circ} \mathrm{C}$ by 1 p.m., but the steel tank is reinforced so that it cannot expand and there is a tight-fitting gas cap with no allowance for an air space or pressure release. What is the pressure on the tank from the heated gasoline, which cannot expand in volume? The bulk modulus for gasoline is $1.00 \times 10^{9} \mathrm{~N} / \mathrm{m}^{2}$.

1 pt The efficiency of a muscle during weight lifting is equal to the work done in lifting the weight divided by the total energy output of the muscle (work done plus internal energy dissipated in the muscle). Determine the efficiency of a muscle that lifts a $154-\mathrm{N}$ weight through a vertical displacement of 0.571 m and dissipates 140 J in the process. Give answer in \%. Do not enter unit.

## 1 pt

A heat engine uses the warm air at the ground as the hot reservoir and the cooler air at an altitude of several thousand meters as the cold reservoir. If the warm air is at $35.5^{\circ} \mathrm{C}$ and the cold air is at $25.7^{\circ} \mathrm{C}$, what is the maximum possible efficiency for the engine?
